

GlacierGrid Case Study

Customer Overview

Duffy's Sports Grill, a popular chain of sports-themed restaurants in Florida, USA, needed a solution to manage energy consumption more effectively across their spread-out locations. Prior to partnering with GlacierGrid, the franchise relied on conventional thermostats, lacking a centralized system to monitor and control energy usage. This decentralized setup led to inefficiencies and rising costs, impacting their bottom line.

Working with GlacierGrid

Duffy's Sports Grill faced operational inefficiencies without a centralized energy management system, as each location managed its own thermostat settings, limiting visibility into energy use and preventing consistent cost-saving practices.

Duffy's benefited from GlacierGrid's data-driven dashboard, which provided intelligent HVAC control and comprehensive monitoring tools to enhance operational efficiency across all locations.

- Intelligent HVAC control for optimized energy use.
- Temperature and humidity monitoring across locations.
- Real-time insights allowing immediate adjustments.
- Centralized control replacing manual thermostat management, streamlining energy oversight
